A Synthetic Study of Layout Parsing

Ada Example and Bo Sample, Example University

Abstract

Document understanding systems convert page images into structured text. We describe a simple pipeline that detects layout regions, orders them and recognises formulas, then evaluate it on a small benchmark of scientific articles. Document understanding systems convert page images into structured text. We describe a simple pipeline that detects layout regions, orders them and recognises formulas, then evaluate it on a small benchmark of scientific articles.

1 Introduction

Document understanding systems convert page images into structured text. We describe a simple pipeline that detects layout regions, orders them and recognises formulas, then evaluate it on a small benchmark of scientific articles. Document understanding systems convert page images into structured text. We describe a simple pipeline that detects layout regions, orders them and recognises formulas, then evaluate it on a small benchmark of scientific articles.

2 Method

Document understanding systems convert page images into structured text. We describe a simple pipeline that detects layout regions, orders them and recognises formulas, then evaluate it on a small benchmark of scientific articles.

$$L = - \sum_i y_i \log p_i \qquad (1)$$

Document understanding systems convert page images into structured text. We describe a simple pipeline that detects layout regions, orders them and recognises formulas, then evaluate it on a small benchmark of scientific articles.

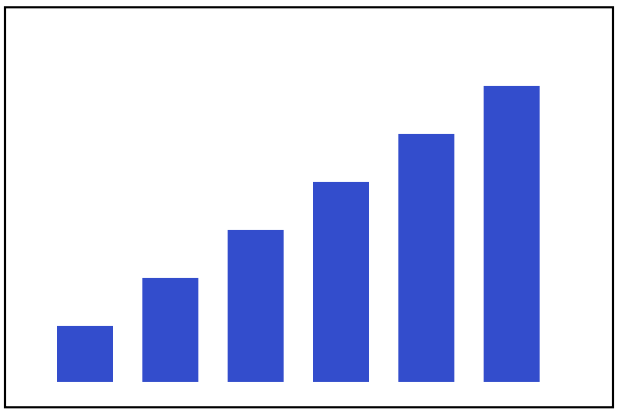

Figure 1. Accuracy of each stage on the synthetic benchmark.

Table 1. Results by block type.

Type	Precision	Recall
Paragraph	0.95	0.93
Heading	0.90	0.88
Equation	0.81	0.77

Document understanding systems convert page images into structured text. We describe a simple pipeline that detects layout regions, orders them and recognises formulas, then evaluate it on a small benchmark of scientific articles.

3 Conclusion

Document understanding systems convert page images into structured text. We describe a simple pipeline that detects layout regions, orders them and recognises formulas, then evaluate it on a small benchmark of scientific articles. Document understanding systems convert page images into structured text. We describe a simple pipeline that detects layout regions, orders them and recognises formulas, then evaluate it on a small benchmark of scientific articles.
